# LEADING CAUSES OF MORTALITY

NORTH CAROLINA  
VITAL STATISTICS 1973-75  
VOLUME 2

ATTENTION!

ERRORS IN NORTH CAROLINA VITAL STATISTICS RATES

Unquestionably, population estimation is a precarious undertaking, even in the best of circumstances. But confounded by errors in the Decennial Census, the situation becomes extremely unsettling as in the case of ten North Carolina counties whose revised Census figures, detailed for age, race and sex, have recently been released. The revised figures not only affect the 1970 data for the ten counties and the state as a whole, but are reflected in post-censal estimates as well as all 1960 to 1970 intercensal estimates computed since 1970. These revisions in turn affect corresponding vital statistics rates and other indices involving population denominators.

The ten counties, listed in descending order of the magnitude of the percentage change in Census totals, are: Swain, Hertford, Northampton, Warren, Halifax, Forsyth, Orange, Wake, Alamance and Guilford. The percentage changes in totals range from 12.4% to 0.02% but larger changes may be expected in some age, race or sex categories.

Since North Carolina's official 1970 Census total was certified to the President at 5,082,059, it will never be changed. However, the actual count is now reported to have been 5,084,411.

Population bases of this report reflect the corrected Census figures. They also reflect, for all 100 counties and the State, further refinements in the input data and computer program used by the Office of State Planning to produce the estimates. These refinements involve changes in the projection

formula as well as improved procedures for making race-specific estimates, and they account for substantial changes in rates in some cases. Counties desiring to update prior-year (1960-1974) vital statistics rates should contact the Public Health Statistics Branch to obtain the new population bases. Based on comparisons for 1974, the following counties are particularly subject to changes in race-specific rates:

Alexander	Dare	Northampton
Bladen	Edgecombe	Pamlico
Burke	Hyde	Pitt
Camden	Jackson	Polk
Carteret	Lenoir	Scotland
Cherokee	Lincoln	Swain
Craven	Martin	Yadkin
Currituck	New Hanover	Yancey

Some final words concerning the entire matter of population bases . . . . From a Federal perspective, the reliability of the Decennial Census must be above reproach. The effort and cost of maintaining a census is of monumental proportions, and it is tragic if faulty quality control makes the product of this effort suspect. From the State level, most methods of estimating the needs of North Carolina citizens and the effectiveness of State-sponsored programs in meeting these needs are dependent upon uniform and reliable post-censal estimates and projections. There is a strong State need for one official set of estimates and projections based on:

- careful review of alternative estimation and projection techniques;
- selection of the most appropriate technique which meets an acceptable standard of precision for North Carolina counties;
- establishment of strict quality control procedures on the input data and on the computer programs which generate these estimates and projections.

# NORTH CAROLINA COUNTIES AND DEPARTMENT OF HUMAN RESOURCES REGIONS

## I. INTRODUCTION

In April of 1975 the Public Health Statistics Branch produced a major publication describing North Carolina's mortality experience for the period 1971-73. That volume, which included mapped and tabular data and associated analyses for leading causes of death in the State's 100 counties, will be repeated every three years. In the interim, supportive reports of the tabular data will be published annually.

This volume is a supportive report which may be used in conjunction with the major publication for purposes of current health planning and analysis. The Public Health Statistics Branch will also continue to publish the report Detailed Mortality Statistics which provides annual counts of deaths classified according to the specific causes of death and the age, race and sex of the decedents.

The tables of this report provide selected mortality statistics for counties, Department of Human Resources Regions, Health Service Areas, and the State (see maps on preceding pages). More than a dozen of North Carolina's leading causes of mortality are depicted in these tables; in addition, various cancer sites are tabled with their respective mortality counts and rates. Total infant mortality data is shown in Table 28 on page 63, and Table 1 on page 9 describes the cause of death categories in terms of codes from the International Classification of Diseases, Adapted.

## II. NORTH CAROLINA MORTALITY TRENDS FROM 1973 THRU 1975

After reaching its highest peak in more than thirty years in 1972, North Carolina's general mortality rate declined steadily between 1973 and 1975. From a 1973 rate of 9.0 deaths per 1,000 population, the 1975 death rate dropped to 8.4, the lowest since 1962. While this decline was experienced by both race groups, it was not shared equally between them. Nonwhites experienced the greatest percentage decline: 7.7% compared to 6.2% for whites.

The trend since 1968 has been towards a greater decline among nonwhites. In 1968 the nonwhite mortality rate was 25% higher than the white rate; in 1973 it was 18% higher, and in 1975 it was 16% higher.

As the gap between the rates for whites and nonwhites has diminished, the margin between the mortality rates for men and women has widened. North Carolina men experienced a 41.0% higher mortality rate than women in the State during 1973. By 1975 the male rate was 47.7% higher. The male death rate is not increasing; rather, the mortality rate for women is declining faster. From 1973 to 1975, the male rate decreased 4.7% from 10.6 to 10.1 per 1,000 population. At the same time, the rate for women declined 9.0% from 7.5 to 6.8. Women have traditionally had lower mortality rates than men in American society and this trend is increasing in North Carolina.

Of the four race-sex groups described in this volume, nonwhite males had the highest mortality rate, followed by white males, nonwhite females and white females.

Not only have resident mortality rates declined for all race-sex groups, but for all eight age groups studied as well. Whites had lower mortality

rates than nonwhites in every age group. The nonwhite rate was approximately twice as high in the 0-4, 25-34, 35-44, and 45-54 age groups. The higher nonwhite rate in the 0-4 age group was compounded by a 20 percent decline among whites of the same age during the period 1973-75, compared to a 13 percent decline for nonwhites. While percentage declines were about the same for both races in the 25-34 age group, nonwhite declines were two times higher in the 35-44 age group and nearly three times higher in the 45-54 group. These large declines in nonwhite mortality largely explain why the nonwhite general mortality rate decreased more than the white rate in the same time period.

Of the 25 selected causes of death tabled in this volume, 16 reflect declining mortality rates from 1973 to 1975. Heart disease, the leading cause of death in the state and nation, declined 6.6 percent from 326.3 per 100,000 population in 1973 to 304.7 in 1975. Cerebrovascular diseases as the third leading cause of death declined 13.1 percent from 110.8 to 96.3. Deaths from motor vehicle accidents declined 21.6 percent dropping from a 1973 rate of 35.7 to the 1975 rate of 28.0. This decline is felt to be largely the result of the 1974 decision to lower the maximum speed limit to 55 miles per hour.

The selected causes of death in this volume represent 85 percent of North Carolina's total resident mortality in 1975. Of these causes, only malignant neoplasms and suicide have shown rate increases during the 1973-75 period. Diabetes increased from a rate of 16.5 in 1973 to 18.4 in 1974 but then dropped to 15.8 in 1975 for a net drop during the three-year period.

The increasing importance of suicide as a leading cause of death is illustrated by the fact that it was the eleventh leading cause of death in 1973, the tenth in 1974, and the ninth in 1975. This trend does not mean there has been a dramatic increase in the number of suicide deaths; in fact, 36 additional

suicides accounted for an increase of only 2.3 percent, from 13.2 in 1973 to 13.5 in 1975. The trend is particularly disturbing, though, because the increase has largely occurred among persons below age 35.

While cancer mortality increased only three percent, that increase resulted from 429 more cancer deaths in 1975 than in 1973. Among the eight cancer sites listed in this volume, three reflect a mortality rate decline: the rate for stomach cancer dropped from 5.5 to 5.2; ovarian cancer from 8.1 to 7.4; and cervical cancer from 7.1 to 6.4. Leukemia and breast cancer rates remained about the same as they had been in 1973. For the most part, it was the larger killers that showed rate increases. Lung cancer, accounting for 146 more deaths in 1975 than in 1973, showed a rate increase of 6.4%, from 29.9 to 31.8. The second largest killer among cancer sites proved to be cancer of the large intestine and rectum. Colon and rectum cancer accounted for 78 more deaths in 1975 than 1973 as the rate increased 7.8% to a level of 15.2 in 1975.

Prostate cancer and pancreatic cancer both showed increases during the three-year period. Cancer of the prostate increased 9.1% to a rate of 19.2 in 1975. Pancreatic cancer decreased 8.6% from 1973 to 1974 and then increased 14.9% to a 1975 rate of 8.5.

### III. MORTALITY RATES

#### Computation

In this report, general mortality rates are expressed as deaths per 1,000 population while all cause-specific mortality rates are expressed as deaths per 100,000 population. The infant mortality rates of Table 28 are computed as the number of infant deaths per 1,000 live births.

The following definitions apply to the rates of Tables 1-27:

Annual Death Rate: the annual death rate computed as resident deaths per 1,000 or 100,000 population. These rates permit the user knowledge of an area's status with respect to the actual incidence of mortality during the given year.

3-Year  
Death Rate: the average annual death rate computed as average resident deaths per 1,000 or 100,000 average population. These rates permit the user knowledge of an area's status with respect to the actual incidence of mortality during the 3-year period.

3-Year  
Adjusted  
Death Rate: The average annual age-race-sex-adjusted rates, computed by the direct method. Also expressed as deaths per 1,000 or 100,000 population, these rates are those which would be expected if the average annual age, race and sex composition of each county's population were the same as that estimated for the State. These rates are free of the effects of age, race and sex and thus permit the user knowledge of an area's status with respect to other determinants of mortality during the 3-year period.

Population bases for the rates described above were provided by the Office of State Planning of the North Carolina Department of Administration.

### Interpretation

To assess an area's relative mortality conditions during a three year period both the actual rate and the adjusted rate can be compared to the State rate for a particular cause of death. Then, provided the area's actual rate represents a relatively stable situation, viz., the rate has not fluctuated widely in recent years, the following alternative diagnoses will apply:

<u>Relative Status of</u> <u>Actual Rate    Adjusted Rate</u>		<u>Diagnosis</u>
Low	Low	Low mortality is not due to age, race and sex factors; other mortality conditions are favorable.
Low	High	Low mortality is due to favorable age, race and sex factors; other mortality conditions are unfavorable.
High	Low	High mortality is due to unfavorable age, race and sex factors; other mortality conditions are favorable.
High	High	High mortality is not due to age, race and sex factors; other mortality conditions are unfavorable.

Again, in assessing the relative mortality conditions of a county be particularly aware of small numbers of deaths. In such cases, random fluctuation in the rate may render rate comparisons invalid.
